JAHN M150

Casting Mortar

This material is specially formulated for casting replacement pieces that can be custom colored to match the original and is ready for use after only two days of curing. Jahn M150 dry-pack mortar provides fine replication of detail and true masonry texture. M150 is formulated to replicate the appearance of natural stone, terra cotta, or architectural concrete and provide limitless design possibilities. This “cast stone” quality mortar is completely mineral based, free of any latex or acrylic bonding agents or additives, and is extremely durable and highly resistant to freeze-thaw damage.

Features and Benefits

- **Single-Component**: Mixes with water only, improving quality control and consistency of application.
- **Contains No Latex or Acrylic Additives**
- **Factory Controlled**: No field chemistry resulting in product variation.
- **Custom Colored Upon Request**: Closely matches existing masonry. Choose from Standard or Custom Colors.
- **Dry Pack System**: Stronger, denser castings eliminate air voids and produce higher quality reproductions.
- **Highly Resistant to Carbonation**: Superior long-term, reinforcing steel protection.

Casting Procedures

**Preparation**

Prior to packing the mold, a non-staining mold release should be applied to all surfaces, making sure to treat undercut areas well.

**Exposed Ferrous Metals**

In the event that ferrous metal reinforcement (rebar, threaded rod, etc.) is exposed within the repair area or repairs are adjacent to ferrous metal jambs, lintels, anchoring systems etc., a rust inhibitor must be applied to all properly prepared ferrous metal surfaces before repairs are made.

**Mixing**

The mixing ratio is approximately 7 parts powder to 1 part water by volume, depending on temperature and humidity. More water may be required as ambient temperature rises. The mixing may be done by hand, stirring until the mortar is thoroughly mixed. The mortar should be the consistency of damp sand. M150 may also be mixed using a slow speed drill (400 - 600 rpm) equipped with a Jiffler-type mixing paddle. For best results, add the powder to the water slowly. The working time will vary, depending upon wind, temperature, and humidity.

**Casting**

Clean the mold of all foreign material, which could cause imperfections. Coat the mold with a non-staining release agent. Scoop approximately 1/3 of the mixed mortar into the mold and tamp it firmly. Press the initial application into place by hand, making certain to completely fill intricate detailing and undercut areas. As the build-up of material proceeds, tamp mortar repeatedly to consolidate. Compaction may be performed using wood tamp and a mallet. Proper compaction is essential for sharp edges. Repeat the process until the mold is slightly overfilled.

Once filled and firmly compacted, screed excess material. This should produce a flush surface with the top of the mold. Cover casting with plastic sheeting for approximately 24 hours.

**Curing**

After the initial 12-24 hours has elapsed, uncover the mold and pour clean potable water into the cast until the point of rejection. Recover mold with the plastic. Remove cast from the mold after an additional 24 hours have passed.

**Safety Requirements**

It is recommended that safety goggles, gloves, and a dust mask equipped with P-2 filters (or equivalent) be worn for protection while mixing.
Packaging and Coverage
A 5 gallon plastic pail contains approximately 44 lb. of material. This will produce 0.5 cubic feet of casting mortar.

Storage And Shelf Life
Store material in a dry area away from direct sunlight. Ambient storage conditions should be in the range of 40°F to 90°F with low to average humidity. Average shelf life is 6 months in original, unopened packaging.
